

Graphing Lines Using  $x$ - and  $y$ -intercepts

## Standard Form of a Linear Equation

$$Ax + By = C$$

where A, B, and C are real numbers

x-intercept: where the line crosses the x-axis  
y has to be equal to 0

$$x\text{-int.} = (x, 0)$$

y-intercept: where the line crosses the y-axis  
x has to be equal to 0

$$y\text{-int.} = (0, y)$$

$$y\text{-int.} = (0, y)$$

Use the  $x$ - and  $y$ -intercepts to graph the following equations.

①  $4x - 5y = 20$

x-intercept =  $(5, 0)$

②  $6x + 3y = 12$

x-intercept =  $(2, 0)$

Can use only these 2 points when using this method!

y-intercept =  $(0, -4)$

y-intercept =  $(0, 4)$

$$m = \frac{4}{5}$$

$$m = \frac{-4}{2} = -2$$

$2x - 5y = -10$

x-intercept =  $(-5, 0)$

$4x + y = 8$

x-intercept =  $(2, 0)$

y-intercept =  $(0, 2)$

y-intercept =  $(0, 8)$

$$\textcircled{1} \quad 4x - 5y = 20$$

$$\text{x-int.: } 4x - 5\cancel{(0)} = 20$$

$$\frac{4x}{4} = \frac{20}{4}$$

$$\underline{x = 5}$$

$$\underline{(5, 0)}$$

$$\text{y-int.: } 4\cancel{(0)} - 5y = 20$$

$$\frac{-5y}{-5} = \frac{20}{-5}$$

$$\underline{y = -4}$$

$$\underline{(0, -4)}$$

$$\textcircled{2} \quad 6x + 3y = 12$$

$$\text{y-int.: } 6\cancel{(0)} + 3y = 12$$

$$\frac{3y}{3} = \frac{12}{3}$$

$$\underline{y = 4}$$

$$\underline{(0, 4)}$$

$$\text{x-int.: } 6x + 3\cancel{(0)} = 12$$

$$\frac{6x}{6} = \frac{12}{6}$$

$$\underline{x = 2}$$

$$\underline{(2, 0)}$$
